Waitlist Match: aftercare plan

Who looks after it, what it costs, and what happens when it gets one wrong

1. Who looks after it

Who	What they do	Time
Tanya (Bethany on Saturdays)	Uses it after each late cancellation and at 8:00. Adds new people. Crosses off the names on the weekly cross-off list.	Less time than the green book today
Julie	Saves the Kneadly export in the Data folder each Friday. Adds new shorthand words or column names in the settings files. Runs the self-check if something looks wrong. Includes the Data folder in the clinic backup.	About 1 hour a month
Marc	Approves add-ons (daily report, text offers, Kneadly Direct). Reads the monthly results page.	10 minutes a month
Builder (Avijit)	Only if a code change is needed. Julie sends `Data\logs\errors.txt` and the problem line. An update replaces the `app` folder; data and settings stay.	As needed

2. What it costs to run

- **$0 a month.** It runs on the desk computer. No subscription, no internet, no outside service.
- Staff time: about 1 hour a month (Julie) plus the weekly cross-offs (Tanya).
- Optional later, only with Marc's approval: daily Kneadly report $0; text offers about $3-12 a month; Kneadly Direct needs the higher Kneadly plan (about $45 a month more, not yet checked).

3. What happens when it gets one wrong

What went wrong	What happens	Who fixes it, and how
It suggests someone who does not fit	Tanya sees the reason next to the name before she calls, and skips them.	Tanya fixes the notebook line. Julie adds the misread word to `settings\shorthand.ini` and runs the answer-key test.
It suggests someone who already booked or left	Tanya skips them. The data-age warning shows when the booking file is old.	Julie saves a fresh export. Tanya adds a note such as "take off" to the notebook.
It misses someone who would have said yes	The opening shows fewer names or "nobody". The person is usually under "Check by hand" or on the Unknown words list.	Julie adds the word to the word list. Tanya rewrites the line in the usual shorthand.
A wrong offer was already made	Only one person is offered at a time, so two people can never both say yes.	Tanya apologises and that person is offered first next time (Marc's rule).
The program stops or a file changes	It shows a plain message, e.g. "save this file as CSV" or "export has changed, call Julie".	Julie runs `setup\Self-check.bat` and reads `Data\logs\errors.txt`. Until fixed, Tanya uses the green book as before.

4. How we know it keeps working

- Monthly results page (Reports): late openings, refilled, refill rate and empty time. Starting point: 3 in 11 (27%). Target: 7 in 10 (70%).
- After any settings change, Julie runs the answer-key test. It must say PASS with 0 wrong names.
- Privacy: health details never appear on screen or in any message; the Data folder stays on the desk computer.
